

103.1002.12

IN THE CLAIMS:

Please amend the claims such that the pending claims read as follows:

Claims 1 and 2 (Cancelled)

SUB D17

3. (Previously Amended) A method for recording a plurality of data about a plurality of blocks of data stored in a storage system, comprising the steps of:
maintaining multiple usage bits for each of said plurality of blocks, wherein one bit of said multiple usage bits for each of said plurality of blocks indicates a block's membership in an active file system and plural bits of said multiple usage bits for each of said plurality of blocks indicate membership in plural read-only copies of a file system; and
storing, in said storage system, said multiple usage bits for each of said plurality of blocks.

4. (Previously Added) A method as in claim 3, wherein one or more bits of said multiple usage bits for each of said plurality of blocks further indicate block reusability.

5. (Previously Amended) A method for generating a consistency point for a storage system, comprising the steps of:

marking a plurality of inodes pointing to a plurality of modified blocks in a file system stored on said storage system as being in a consistency point;

103.1002.12

flushing regular files to said storage system;
flushing special files to said storage system;
flushing at least one block of file system information to said storage system;
queuing dirty inodes after said step of marking and before said step of flushing at
least one block of file system information; and
requeuing any of said dirty inodes that were not part of said consistency point
after said step of flushing at least one block of file system information.

6. (Previously Added) A method as in claim 5, wherein said step of flushing said
special files to said storage system further comprises the steps of:

pre-flushing an inode for a blockmap file to an inode file;
allocating space on said storage system for all dirty blocks in said inode and said
blockmap files;
flushing said inode for said blockmap file again;
updating a plurality of entries in said blockmap file wherein each entry of said
plurality of entries represents a block in said storage system; and
writing all dirty blocks in said blockmap file and said inode file to said storage
system.

7. (Previously Amended) A method of maintaining data in a storage system,
comprising the steps of:

103.1002.12

maintaining a root node and inodes for a file system, the root node pointing directly or indirectly to the inodes, and each inode storing file data, pointing to one or more blocks in the storage system that store file data, or pointing to other inodes;

maintaining an inode map and a block map for the file system; and

after data in the file system is changed, temporarily storing new data and inodes affected by the new data in memory before writing the new data and inodes affected by the new data to the storage system, using a list of dirty inodes to coordinate writing the new data and inodes affected by the new data to new blocks in the storage system, maintaining old data in old blocks in the storage system, updating the inodes and inode map to reflect the new blocks, and updating the block map, with the block map showing that both the new blocks and the old blocks are in use;

whereby a record of changes to the file system is automatically maintained in the storage system.

Claims 8 and 9 (Cancelled)

10. (Previously Added) A method as in claim 7, further comprising the step of creating a snapshot of the file system by copying the root node.

11. (Previously Added) A method as in claim 10, wherein the block map indicates membership of blocks in one or more snapshots.

103.1002.12

12. (Previously Added) A method as in claim 10, further comprising the step of deleting a snapshot from the storage system, wherein blocks that are only part of the deleted snapshot are released for re-use by the storage system.

13. (Previously Amended) A memory storing information including instructions, the instructions executable by a processor to record a plurality of data about a plurality of blocks of data stored in a storage system, the instructions comprising the steps of:

maintaining multiple usage bits for each of said plurality of blocks, wherein one bit of said multiple usage bits for each of said plurality of blocks indicates a block's membership in an active file system and plural bits of said multiple usage bits for each of said plurality of blocks indicate membership in plural read-only copies of a file system; and

storing, in said storage system, said multiple usage bits for each of said plurality of blocks.

14. (Previously Added) A memory as in claim 13, wherein one or more bits of said multiple usage bits for each of said plurality of blocks further indicate block reusability.

15. (Previously Amended) A memory storing information including instructions, the instructions executable by a processor to generate a consistency point for a storage system, the instructions comprising the steps of:

marking a plurality of inodes pointing to a plurality of modified blocks in a file system stored on said storage system as being in a consistency point;

103.1002.12

flushing regular files to said storage system;
flushing special files to said storage system;
flushing at least one block of file system information to said storage system;
queuing dirty inodes after said step of marking and before said step of flushing at
least one block of file system information; and
requeuing any of said dirty inodes that were not part of said consistency point
after said step of flushing at least one block of file system information.

16. (Previously Added) A memory as in claim 15, wherein said step of flushing
said special files to said storage system further comprises the steps of:

pre-flushing an inode for a blockmap file to an inode file;
allocating space on said storage system for all dirty blocks in said inode and said
blockmap files;
flushing said inode for said blockmap file again;
updating a plurality of entries in said blockmap file wherein each entry of said
plurality of entries represents a block in said storage system; and
writing all dirty blocks in said blockmap file and said inode file to said storage
system.

17. (Previously Amended) A memory storing information including instructions,
the instructions executable by a processor to maintain data in a storage system, the instructions
comprising the steps of:

103.1002.12

maintaining a root node and inodes for a file system, the root node pointing directly or indirectly to the inodes, and each inode storing file data, pointing to one or more blocks in the storage system that store file data, or pointing to other inodes;

maintaining an inode map and a block map for the file system; and

after data in the file system is changed, temporarily storing new data and inodes affected by the new data in memory before writing the new data and inodes affected by the new data to the storage system, using a list of dirty inodes to coordinate writing the new data and inodes affected by the new data to new blocks in the storage system, maintaining old data in old blocks in the storage system, updating the inodes and inode map to reflect the new blocks, and updating the block map, with the block map showing that both the new blocks and the old blocks are in use;

whereby a record of changes to the file system is automatically maintained in the storage system.

Claims 18 and 19 (Cancelled)

20. (Previously Added) A memory as in claim 17, wherein the instructions further comprise the step of creating a snapshot of the file system by copying the root node.

21. (Previously Added) A memory as in claim 20, wherein the block map indicates membership of blocks in one or more snapshots.

103.1002.12

22. (Previously Added) A memory as in claim 20, wherein the instructions further comprise the step of deleting a snapshot from the storage system, wherein blocks that are only part of the deleted snapshot are released for re-use by the storage system.

23. (Previously Amended) A system comprising:

a processor;

a storage system; and

a memory storing information including instructions, the instructions executable by the processor to record a plurality of data about a plurality of blocks of data stored in the storage system, the instructions comprising the steps of: (a) maintaining multiple usage bits for each of said plurality of blocks, wherein one bit of said multiple usage bits for each of said plurality of blocks indicates a block's membership in an active file system and plural bits of said multiple usage bits for each of said plurality of blocks indicate membership in plural read-only copies of a file system; and (b) storing, in said storage system, said multiple usage bits for each of said plurality of blocks.

24. (Previously Amended) A system as in claim 23, wherein one or more bits of said multiple usage bits for each of said plurality of blocks further indicate block reusability.

25. (Previously Added) A system comprising:

a processor;

a storage system; and

103.1002.12

a memory storing information including instructions, the instructions executable by the processor to generate a consistency point for the storage system, the instructions comprising the steps of: (a) marking a plurality of inodes pointing to a plurality of modified blocks in a file system stored on said storage system as being in a consistency point; (b) flushing regular files to said storage system; (c) flushing special files to said storage system; (d) flushing at least one block of file system information to said storage system; (e) queuing dirty inodes after said step of marking and before said step of flushing at least one block of file system information; and (f) requeuing any of said dirty inodes that were not part of said consistency point after said step of flushing at least one block of file system information.

26. (Previously Added) A system as in claim 25, wherein said step of flushing said special files to said storage system further comprises the steps of: (f) pre-flushing an inode for a blockmap file to an inode file; (g) allocating space on said storage system for all dirty blocks in said inode and said blockmap files; (h) flushing said inode for said blockmap file again; (i) updating a plurality of entries in said blockmap file wherein each entry of said plurality of entries represents a block in said storage system; and (j) writing all dirty blocks in said blockmap file and said inode file to said storage system.

27. (Previously Amended) A system comprising:
a processor;
a storage system; and

103.1002.12

C3

a memory storing information including instructions, the instructions executable by the processor to maintain data in the storage system, the instructions comprising the steps of: (a) maintaining a root node and inodes for a file system, the root node pointing directly or indirectly to the inodes, and each inode storing file data, pointing to one or more blocks in the storage system that store file data, or pointing to other inodes; (b) maintaining an inode map and a block map for the file system; and (c) after data in the file system is changed, temporarily storing new data and inodes affected by the new data in memory before writing the new data and inodes affected by the new data to the storage system, using a list of dirty inodes to coordinate writing the new data and inodes affected by the new data to new blocks in the storage system, maintaining old data in old blocks in the storage system, updating the inodes and inode map to reflect the new blocks, and updating the block map, with the block map showing that both the new blocks and the old blocks are in use;

whereby a record of changes to the file system is automatically maintained in the storage system.

Claims 28 and 29 (Cancelled)

SUB D47

30. (Previously Amended) A system as in claim 27, wherein the instructions further comprise the step of creating a snapshot of the file system by copying the root node.

C4

31. (Previously Amended) A system as in claim 30, wherein the block map indicates membership of blocks in one or more snapshots.

103.1002.12

32. (Previously Amended) A system as in claim 30, wherein the instructions further comprise the step of deleting a snapshot from the storage system, wherein blocks that are only part of the deleted snapshot are released for re-use by the storage system.

33. (Previously Amended) A system for maintaining data in storage means, comprising the steps of:

means for maintaining a root node and inodes for a file system, the root node pointing to inodes, and each inode storing file data, pointing to one or more blocks in the storage means that store file data, or pointing to other inodes;

means for maintaining an inode map and a block map for the file system; and

C4
means for, after data in the file system is changed, temporarily storing new data and inodes affected by the new data in memory before writing the new data and inodes affected by the new data to the storage system, using a list of dirty inodes to coordinate writing the new data and inodes affected by the new data to new blocks in the storage system, maintaining old data in old blocks in the storage system, updating the inodes and inode map to reflect the new blocks, and updating the block map, with the block map showing that both the new blocks and the old blocks are in use;

whereby a record of changes to the file system is automatically maintained in the storage means.
